

# Language Support

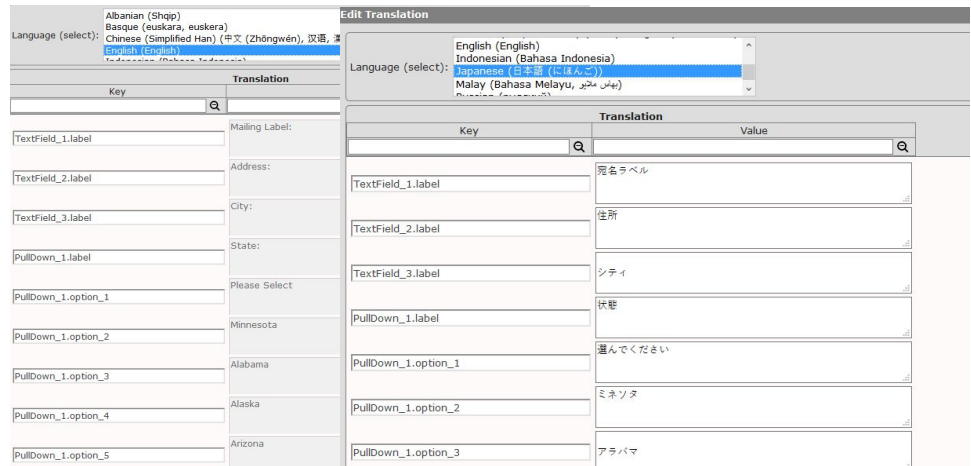

## Overview

RapidBIZ supports translation of field labels and messages to any other language. Translations can be done on a screen by screen basis by a developer (or developer assistant); or the screens labels can be exported where “bulk” translation can be accomplished, then uploaded back into RapidBIZ for the target application. When a translated application is delivered, a pulldown will appear on the user screen where they can then select their preferred language.

## Screen by Screen Translation

In the example below, this screen was translated from English as the base development language, to Japanese (using google translate manually). While this method may not always produce the most contextually accurate translations, you can see how easy it is to perform the conversion.

## User View

Based on the language the user has selected – you can see below how the translations appear for both the field labels, the buttons and the icons.

### **RapidBIZ Translations**

While the developer can select the language they would like to develop in; i.e. Spanish – becoming the base language for the app, RapidBIZ itself is in English and does not appear in other languages.
